Byers Peak Overview

Manufacturing Readiness

With years of experience introducing over 50 products to market, we can turn your design and production goals into a step-by-step manufacturing readiness strategy. Sourcing your BOM, qualifying custom tooling, developing manufacturing processes and test systems, supporting your regulatory approvals, building prototypes or clinical trial units are just a few of the activities we can manage for you.

Regulatory Experience

Whether you need regulatory approval support for the FDA, CE, UL, ETL... we have pragmatic regulatory experience to support agency approvals in a timely manner.

Once approved, our quality systems will ensure we maintain compliance for agency audits through the life of your product

Device Manufacturing

We practice a work-cell manufacturing model that is scalable from prototypes through your production ramp. Manufacturing and test procedures are the cornerstone of our quality system and ensure quality at every stage of production from assembly, testing, burn-in, packaging and distribution.

Disposable Manufacturing

Our class 100,000 certifiable clean room is set up for early stage production of hand pieces and disposable devices. Assembly, soldering, sonic welding, package sealing and managing the sterilization process are some of the disposable manufacturing services we provide our customers.

Post Production Services

Providing repair depot services is a natural extension of our manufacturing capabilities. We can manage the inventory and troubleshooting processes needed to resolve any field failure issues. We provide segregated production and service manufacturing cell to ensure the ability to ship new and repaired units on the same day.

Whether its spare parts or spare part refurbishment, we have the ability to manage both field requirements. We can ship directly to your field service techs, clinics and hospitals.

Our factory trained service techs that can repair or upgrade devices in the field. This can be established as a standard practice or developed to help with a surge in requirements of your current field service group.
